${\tt df_print}$ should be set back to kable etc

Doing things with data frames

Let's go back to our Australian athletes:

```
##
## -- Column specification
## cols(
##
     Sex = col character(),
##
     Sport = col_character(),
##
     RCC = col double(),
##
     WCC = col double(),
##
     Hc = col double(),
     Hg = col double(),
##
##
     Ferr = col double(),
##
     BMI = col double(),
     SSF = col double(),
##
     `%Bfat` = col_double(),
##
##
     LBM = col double(),
##
     Ht = col double()
```

Choosing a column

```
athletes %>% select(Sport)
```

```
## # A tibble: 202 x 1
##
      Sport
##
     <chr>
  1 Netball
##
##
    2 Netball
    3 Netball
##
##
    4 Netball
##
    5 Netball
##
    6 Netball
    7 Netball
##
##
    8 Netball
    9 Netball
##
## 10 Netball
## # ... with 192 more rows
```

Choosing several columns

```
athletes %>% select(Sport, Hg, BMI)
```

```
## # A tibble: 202 x 3
##
     Sport Hg
                    BMI
## <chr> <dbl> <dbl>
## 1 Netball 13.6 19.2
##
   2 Netball 12.7 21.2
   3 Netball 12.3 21.4
##
##
   4 Netball 12.3 21.0
##
   5 Netball 12.8 21.8
##
   6 Netball 11.8 21.4
   7 Netball 12.7 21.5
##
##
   8 Netball 12.4 24.4
##
   9 Netball 12.4 22.6
## 10 Netball 14.1 22.8
## # ... with 192 more rows
```

Choosing consecutive columns

athletes %>% select(Sex:WCC)

```
## # A tibble: 202 \times 4
##
     Sex
            Sport RCC
                           WCC
##
     <chr> <chr> <dbl> <dbl>
##
   1 female Netball 4.56 13.3
##
   2 female Netball 4.15 6
##
   3 female Netball 4.16 7.6
##
   4 female Netball 4.32 6.4
   5 female Netball 4.06 5.8
##
##
   6 female Netball 4.12 6.1
##
   7 female Netball 4.17
                           5
##
   8 female Netball 3.8 6.6
   9 female Netball 3.96 5.5
##
## 10 female Netball 4.44
                           9.7
## # ... with 192 more rows
```

Choosing all-but some columns

```
athletes %>% select(-(RCC:LBM))
## # A tibble: 202 \times 4
##
     Sex
            Sport Ht
                         Wt.
##
     <chr> <chr> <dbl> <dbl>
   1 female Netball 177. 59.9
##
##
   2 female Netball 173. 63
   3 female Netball 176 66.3
##
##
   4 female Netball 170. 60.7
##
   5 female Netball 183 72.9
##
   6 female Netball 178. 67.9
##
   7 female Netball 177. 67.5
##
   8 female Netball 174. 74.1
   9 female Netball 174. 68.2
##
## 10 female Netball 174. 68.8
```

... with 192 more rows

Select-helpers

Other ways to select columns: those whose name:

- starts_with something
- ends_with something
- contains something
- matches a "regular expression"
- everything() select all the columns

Columns whose names begin with S

```
athletes %>% select(starts_with("S"))
```

```
## # A tibble: 202 x 3
## Sex Sport SSF
## <chr> <chr> <dbl>
##
  1 female Netball 49
##
   2 female Netball 110.
##
   3 female Netball 89
   4 female Netball 98.3
##
##
   5 female Netball 122.
   6 female Netball 90.4
##
##
   7 female Netball 107.
##
   8 female Netball 157.
##
   9 female Netball 101.
## 10 female Netball 126.
## # ... with 192 more rows
```

Columns whose names end with C

either uppercase or lowercase:

```
athletes %>% select(ends_with("c"))
```

```
## # A tibble: 202 \times 3
##
       R.C.C.
             WCC
                    Hс
     <dbl> <dbl> <dbl>
##
##
      4.56 13.3
                  42.2
##
   2
      4.15
             6
                  38
   3 4.16 7.6 37.5
##
      4.32 6.4 37.7
##
##
   5 4.06 5.8 38.7
             6.1 36.6
##
   6
      4.12
##
      4.17
             5
                  37.4
##
   8 3.8 6.6 36.5
##
   9
      3.96
             5.5 36.3
                  41.4
   10
      4.44
             9.7
```

Case-sensitive

##

##

##

10

8 3.8

4.44

9 3.96 5.5

6.6

9.7

This works with any of the select-helpers:

```
athletes %>% select(ends_with("C", ignore.case=F))
## # A tibble: 202 \times 2
       RCC
             WCC
##
##
     <dbl> <dbl>
    1 4.56 13.3
##
##
    2 4.15
             6
    3 4.16 7.6
##
    4 4.32 6.4
##
##
    5 4.06 5.8
##
    6 4.12
             6.1
              5
##
    7
      4.17
```

Column names containing letter R

```
athletes %>% select(contains("r"))
```

```
## # A tibble: 202 x 3
     Sport RCC Ferr
##
##
     <chr> <dbl> <dbl>
   1 Netball 4.56
##
                    20
##
   2 Netball 4.15 59
   3 Netball 4.16 22
##
   4 Netball 4.32 30
##
   5 Netball 4.06 78
##
##
   6 Netball 4.12 21
##
  7 Netball 4.17
                    109
##
   8 Netball 3.8
                    102
   9 Netball 3.96
                 71
##
## 10 Netball 4.44
                    64
## # ... with 192 more rows
```

Exactly two characters, ending with T

In regular expression terms, this is ^.t\$:

- ^ means "start of text"
- means "exactly one character, but could be anything"
- \$ means "end of text".

```
athletes %>% select(matches("^.t$"))
```

```
## # A tibble: 202 x 2
##
        Ht.
              Wt.
     <dbl> <dbl>
##
  1 177, 59,9
##
   2 173, 63
##
##
   3 176 66.3
   4 170. 60.7
##
##
   5 183 72.9
##
   6 178. 67.9
```

Choosing columns by property

- Use where as with summarizing several columns
- eg, to choose text columns:

```
athletes %>% select(where(is.character))
```

```
## # A tibble: 202 x 2
##
      Sex
             Sport
##
      <chr> <chr>
    1 female Netball
##
    2 female Netball
##
##
    3 female Netball
    4 female Netball
##
    5 female Netball
##
##
    6 female Netball
##
    7 female Netball
    8 female Netball
##
##
    9 female Netball
```

Choosing rows by number

```
athletes %>% slice(16:25)
```

```
A tibble: 10 \times 13
##
                      RCC
                            WCC
                                   Hс
      Sex
             Sport
                                         Hg
                                             Ferr
                                                    BMI
      <chr>
            <chr> <dbl> <dbl> <dbl> <dbl> <dbl> <dbl> <dbl> <
##

## 2 BBall 114.
## 3 Field 111.
```

Another way

6 WPolo 101 ## 7 BBall 100.

```
athletes %>%
  slice_max(order_by = Wt, n=7) %>%
  select(Sport, Wt)
## # A tibble: 7 \times 2
##
     Sport
             Wt
   <chr> <dbl>
##
## 1 Field 123.
## 2 BBall 114.
## 3 Field 111.
## 4 Field 108.
## 5 Field 103.
```

Create new variables from old ones

```
athletes %>%
 mutate(wt_lb = Wt * 2.2) \%
 select(Sport, Sex, Wt, wt_lb) %>%
 arrange(Wt)
## # A tibble: 202 x 4
##
     Sport Sex Wt wt lb
  <chr> <chr> <dbl> <dbl>
##
## 1 Gym female 37.8 83.2
   2 Gym female 43.8 96.4
##
   3 Gym female 45.1 99.2
##
##
   4 Tennis female 45.8 101.
##
   5 Tennis female 47.4 104.
##
   6 Gym female 47.8 105.
##
   7 T400m female 49.2 108.
##
   8 Row female 49.8 110.
                     Doing things with data frames
```

Turning the result into a number

Output is always data frame unless you explicitly turn it into something else, eg. the weight of the heaviest athlete, as a number:

```
athletes %>% arrange(desc(Wt)) %>% pluck("Wt", 1)
```

[1] 123.2

Or the 20 heaviest weights in descending order:

```
athletes %>%
  arrange(desc(Wt)) %>%
  slice(1:20) %>%
  pluck("Wt")
```

```
## [1] 123.20 113.70 111.30 108.20 102.70 101.00

## [7] 100.20 98.00 97.90 97.90 97.00 96.90

## [13] 96.30 94.80 94.80 94.70 94.70 94.60

## [19] 94.25 94.20
```

Another way to do the last one

```
athletes %>%
arrange(desc(Wt)) %>%
slice(1:20) %>%
pull("Wt")
```

```
## [1] 123.20 113.70 111.30 108.20 102.70 101.00

## [7] 100.20 98.00 97.90 97.90 97.00 96.90

## [13] 96.30 94.80 94.80 94.70 94.70 94.60

## [19] 94.25 94.20
```

pull grabs the column you name as a vector (of whatever it contains).

To find the mean height of the women athletes

m

<dbl> ## 1 175.

Two ways: athletes %>% group_by(Sex) %>% summarize(m = mean(Ht)) ## # A tibble: 2 x 2 ## Sex ## <chr> <dbl> ## 1 female 175. ## 2 male 186. athletes %>% filter(Sex == "female") %>% summarize(m = mean(Ht)) ## # A tibble: 1 x 1 ##

Summary of data selection/arrangement "verbs"

Verb	Purpose
select	Choose columns
print	Display non-default # of rows/columns
slice	Choose rows by number
${\tt sample_n}$	Choose random rows
filter	Choose rows satisfying conditions
arrange	Sort in order by column(s)
mutate	Create new variables
<pre>group_by</pre>	Create groups to summarize by
summarize	Calculate summary statistics (by groups if defined)
pluck	Extract items from data frame
pull	Extract a single column from a data frame as a vector

Looking things up in another data frame

Recall the tuberculosis data set, tidied:

tb3

```
## # A tibble: 35,750 x 5

```

Actual country names

Found actual country names to go with those abbreviations, in spreadsheet:

```
my_url <-
   "http://www.utsc.utoronto.ca/~butler/c32/ISOCountryCodes081507.xlsx"</pre>
```

Note trick for reading in .xlsx from URL:

```
f <- tempfile()
download.file(my_url, f)
country_names <- read_excel(f)</pre>
```

- set up temporary file
- download spreadsheet to there
- read it from temporary file (which is "local")

The country names

country_names

```
## # A tibble: 252 x 3

Comments

5 RS ## 6 TL

- This is probably not quite right because of:
 - the 1994-1995 thing
 - there is at least one country in tb3 that was not in country_names (the NA above). Which?

```
tb3 %>%
   anti_join(country_names, by = c("iso2" = "Code_UC")) %>%
   distinct(iso2)

## # A tibble: 6 x 1
## iso2
## <chr>
## 1 CD
## 2 ME
## 3 <NA>
## 4 PS
```

Doing things one row at a time

A data frame d:

```
## # A tibble: 3 x 2
##     x1     x2
##     <dbl> <dbl>
## 1     10     13
## 2     11     8
## 3     3     4
```

Want largest value in each row.

Try number 1

```
d \%% mutate(mx = max(x1, x2))
```

```
## # A tibble: 3 x 3
## x1 x2 mx
## <dbl> <dbl> <dbl> <dbl> ## 1 10 13 13
## 2 11 8 13
## 3 3 4 13
```

 Fails because max finds the largest of all values in x1 and x2 (and repeats answer 3 times), rather than max of the two values in each row.

Try number 2

```
d %>% rowwise() %>%
  mutate(mx = max(x1, x2))
```

```
## # A tibble: 3 x 3
## x1 x2 mx
## <dbl> <dbl> <dbl> <dbl> ## 1 10 13 13
## 2 11 8 11
## 3 3 4 4
```

 Works because rowwise works one row at a time: "find max of all numbers in 1st row", then "all in 2nd" etc.

Calculations for groups

 Back to Australian athletes data: suppose we want the correlation between height and weight for athletes of each sport separately:

```
athletes %>% group_by(Sport) %>%
summarize(correl = cor(Ht, Wt))
```

```
## # A tibble: 10 \times 2
##
     Sport
             correl
     <chr>
              <dbl>
##
##
    1 BBall
              0.880
##
   2 Field
              0.471
##
   3 Gym
          0.653
##
   4 Netball
              0.363
##
    5 Row
              0.873
##
    6 Swim
              0.860
##
   7 T400m
              0.828
##
   8 Tennis
              0.826
##
    9 TSprnt
              0.806
   10 WPolo
               0.595
```

Another way

• Break the data set into groups first:

```
athletes %>% nest_by(Sport)
```

```
## # A tibble: 10 x 2
##
      Sport
                          data
##
      <chr> <chr> <tibble>>
##
    1 BBall
                     [25 \times 12]
##
    2 Field
                     [19 x 12]
##
    3 Gym
                     [4 x 12]
##
    4 Netball
                    [23 x 12]

```

Comments

- It looks as if all the other variables have disappeared, but they are all hiding in the column data.
- each thing in data is a dataframe (inside a dataframe!)
- when a column consists of things that are *not* single numbers, pieces of text, etc., it's called a **list-column** (see list in column header).
- to use this, we work rowwise on each sport and the data that belongs to that sport.

The rowwise way

10 WPolo

##

```
athletes %>% nest by(Sport) %>%
 mutate(correl = with(data, cor(Ht, Wt)))
## # A tibble: 10 \times 3
##
     Sport
                       data correl
##
     <chr> <list<tibble>> <dbl>
##
   1 BBall
                  [25 x 12] 0.880
                  [19 x 12] 0.471
##
   2 Field
                 [4 x 12] 0.653
##
   3 Gym
   4 Netball [23 x 12] 0.363
##
   5 Row
                [37 x 12] 0.873
##
##
   6 Swim
                  [22 x 12] 0.860
   7 T400m
                  [29 x 12] 0.828
##
##
   8 Tennis
                  [11 x 12] 0.826
##
   9 TSprnt
                [15 x 12] 0.806
```

[17 x 12]

0.595

Another use of list-columns

 Let's find the five-number summary of heights for male and female athletes:

```
athletes %>%
 group_by(Sex) %>%
 summarize(g = quantile(Ht))
## # A tibble: 10 x 2
##
     Sex
## <chr> <dbl>
   1 female 149.
##
##
   2 female 171.
##
   3 female 175
   4 female 180.
##
##
   5 female 196.
##
   6 male 165.
##
   7 male 180.
##
   8 male 186.
##
   9 male 191
  10 male
             209.
```

Better

```
athletes %>% group_by(Sex) %>%
summarize(q = list(quantile(Ht)))
```

```
## # A tibble: 2 x 2
## Sex q
## <chr> the chief of the chief
```

 each five-number summary is in a list-column, labelled by which Sex it belongs to.

To get this out

to look at it:

##

7 male

9 male

10 male

8 male 186.

180.

191

209.

athletes %>% group_by(Sex) %>% summarize(q = list(quantile(Ht))) %>% unnest(q) ## # A tibble: 10×2 ## Sex <chr> <dbl> ## 1 female 149. ## 2 female 171. ## 3 female 175 ## ## 4 female 180. ## 5 female 196. 165. ## 6 male

Even better

• quantile produces a "named vector" with the quantiles labelled:

```
quantile(athletes$Ht)
```

```
## 0% 25% 50% 75% 100%
## 148.900 174.000 179.700 186.175 209.400
```

which we turn into dataframe thus:

```
enframe(quantile(athletes$Ht))
```

```
## # A tibble: 5 x 2
## name value
## <chr> <dbl>
## 1 0% 149.
## 2 25% 174
## 3 50% 180.
## 4 75% 186.
## 5 100% 209.
```

for males and female athletes

```
athletes %>% group_by(Sex) %>%
  summarize(q = list(enframe(quantile(Ht)))) %>%
  unnest(q)
```

```
## # A tibble: 10 x 3
##
     Sex
        name
                value
##
     <chr> <chr> <dbl>
##
   1 female 0% 149.
   2 female 25% 171.
##
   3 female 50% 175
##
   4 female 75% 180.
##
   5 female 100% 196.
##
   6 male 0% 165.
##
   7 male 25% 180.
##
##
   8 male 50% 186.
   9 male 75% 191
##
  10 male 100%
                 209.
```

Showing off

1 female 149. 171. 175 180. 196. ## 2 male 165. 180. 186. 191 209.
